

- 1/ Give the atomic number, mass number, and number of neutrons for the following nuclei:

$^{238}\text{U}$ ,  $^{60}\text{Co}$ ,  $^{131}\text{I}$ ,  $^{151}\text{Eu}$ ,  $^{194}\text{Ir}$ ,  $^{137}\text{Cs}$ .

- 2/ Which one of the following is a mirror nuclear pair?

$^{110}\text{Cd} - ^{110}\text{Pd}$     $^{144}\text{Nd} - ^{144}\text{Sm}$     $^{74}\text{Se} - ^{74}\text{Ge}$     $^{124}\text{Te} - ^{124}\text{Sn}$     $^{90}\text{Ru} - ^{90}\text{Pd}$

- 3/ Calculate the radius of a  $^{97}\text{Tc}$  nucleus.

[5.51fm]

- 4/ A beam of 250MeV electrons strikes a target of  $^{116}\text{Sn}$  nuclei.

- Calculate the wavelength of these electrons
- If the resultant diffraction pattern has a minimum at  $31.12^\circ$ , calculate the diameter of the  $^{116}\text{Sn}$  nuclei.

[4.96fm, 11.71fm]

- 5/ An exchange particle, the  $\omega$  meson has a range of interaction of 0.126fm. Use the uncertainty principle to calculate the mass of the  $\omega$  meson.

[782MeV ]

- 6/ A hypothetical particle has a mass of 8.51 amu ( $= 1.41 \times 10^{-26}$  kg). Calculate the equivalent mass in MeV.

[7930MeV ]

- 7/ The mass of a nucleus of  $^{208}\text{Pb}$  is 207.9316746amu. If the mass of a free proton is 1.00728 amu and a free neutron is 1.008665 amu

- calculate, using  $E = mc^2$ , the binding energy for the  $^{208}\text{Pb}$  nucleus in Joules (note, one amu =  $1.6605 \times 10^{-27}$ kg,  $c=3 \times 10^8$ m/s).
- express this energy in MeV
- calculate the binding energy per nucleon.

[ $2.63 \times 10^{-10}$  J, 1641MeV, 7.89MeV ]

- 8/ Given the nuclear mass for  $^{165}\text{Re}$  is 164.96709amu and that of  $^{161}\text{Ta}$  is 160.95837amu, calculate the maximum energy of alpha particles emitted when  $^{165}\text{Re}$  decays to  $^{161}\text{Ta}$ . Take the mass of an alpha particle to be 4.00260 amu, the speed of light to be  $3 \times 10^8$  m/s, the mass of an amu to be  $1.661 \times 10^{-27}$  kg and the charge on an electron to be  $1.602 \times 10^{-19}$  C.

[5.70MeV ]
